ABSTRACT

An attachment apparatus for attaching a ground following implement, such as a power rotary broom, to a front portion
5 of a vehicle comprises a frame pivotally attachable to the vehicle about a first pitch axis such that a front end of the frame is positioned in front of the vehicle. The front end of the frame is pivotally attachable to an implement about a second pitch axis. Castor wheels are arranged to
10 support the frame for movement along the ground. A front mounted broom is driven at a mid-point so that no drive parts protrude from either end thereof.
